

> Google's new robot AI sorted car parts on real Mercedes lines. It got 96% right

Gemini Robotics 2.5 drove Apptronik's Apollo 2 humanoid. Google hasn't said how many picks the 96% covers. What do we know?

> 01 — WHAT HAPPENED

Google DeepMind's Gemini Robotics 2.5 runs robot hands

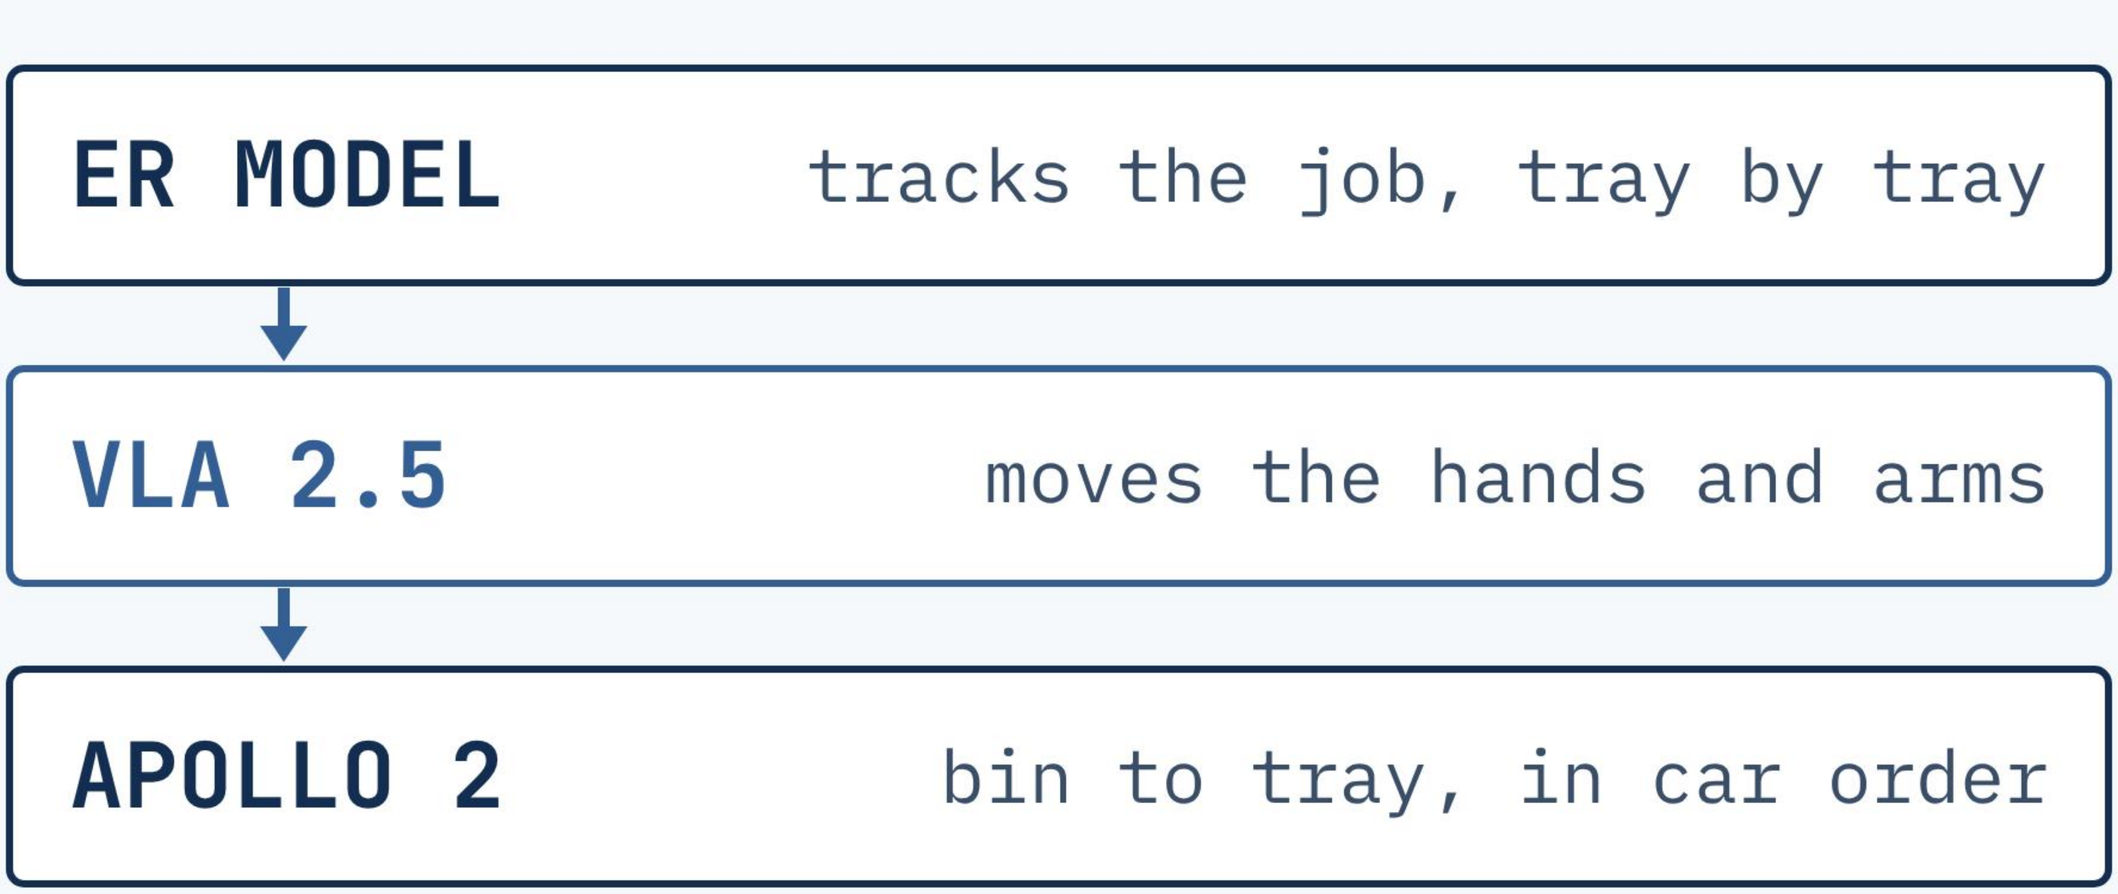

Gemini Robotics 2.5 is a VLA, a model that turns camera images and an instruction into arm and hand motion. Google tested it on over 200 tasks, like tying this bow.

For factories, one model can learn a new handling job: Apptronik says a few weeks of extra training readied it for a car plant.

> 02 — HOW IT WORKS_

At Mercedes, two Google models split the kitting job

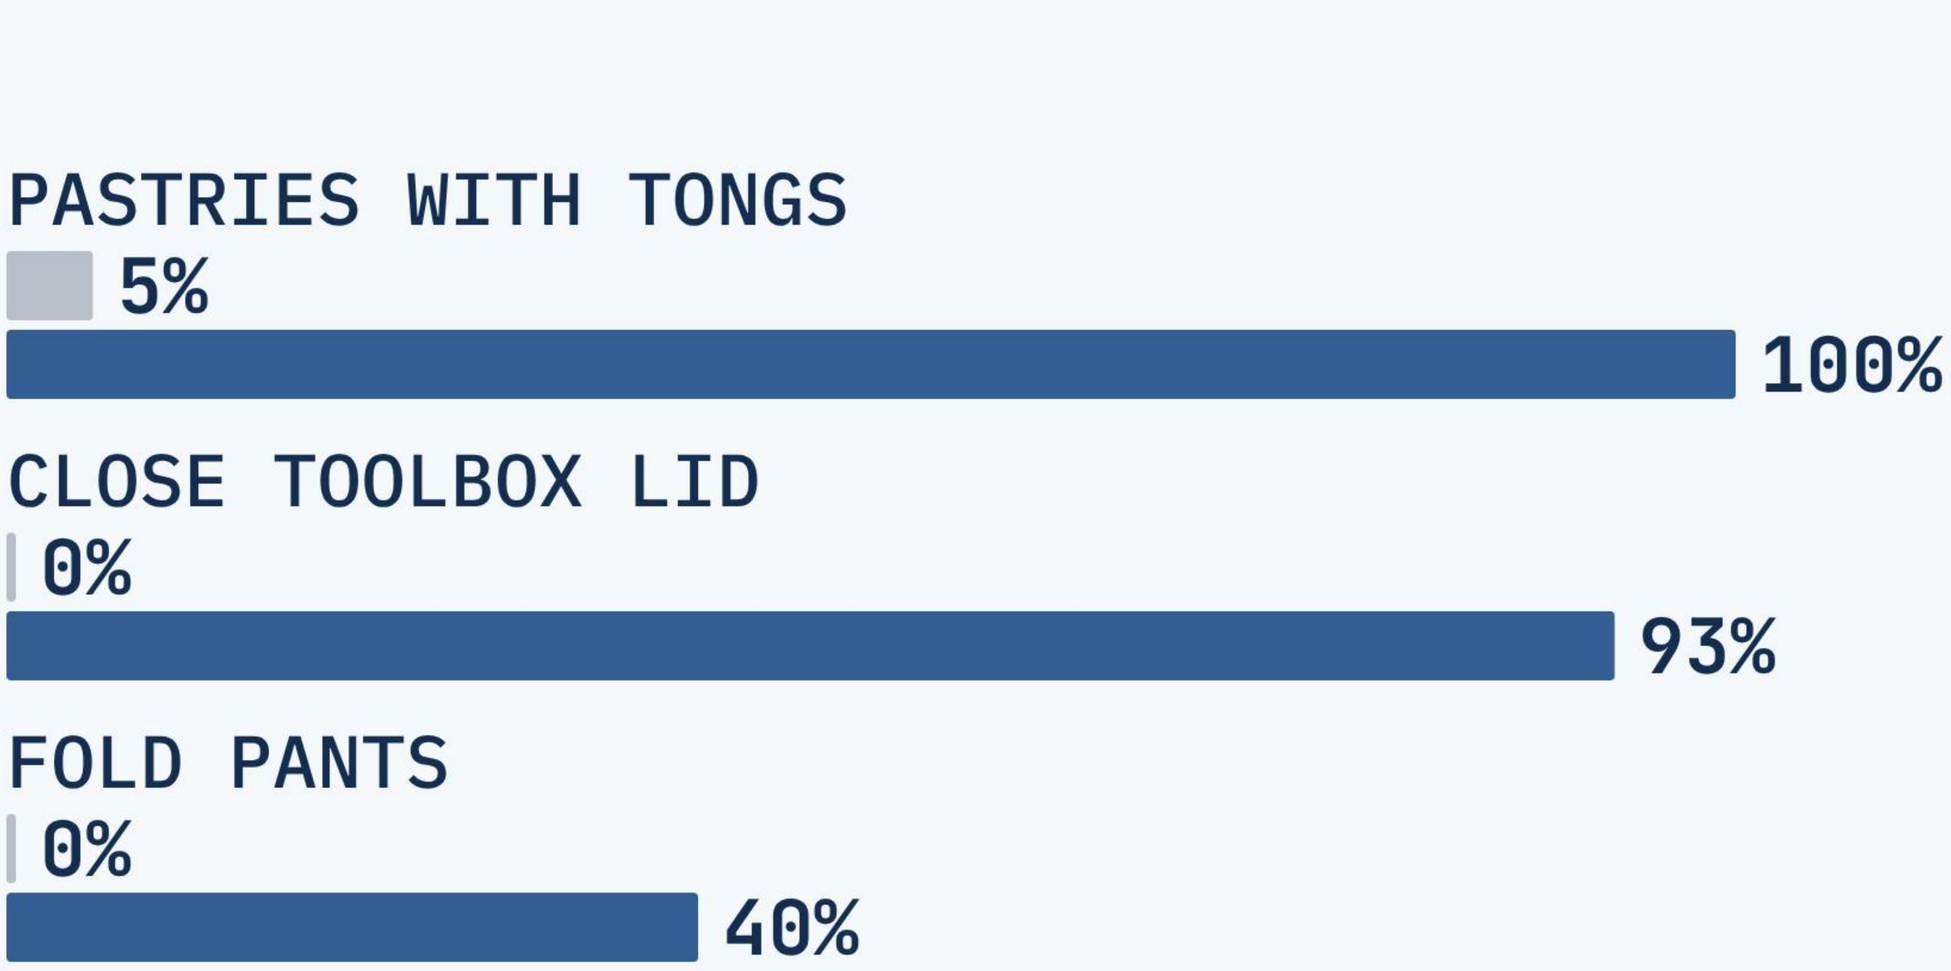

Kitting means picking metal brackets from bulk bins into trays, in the order each car needs them. Gemini Robotics ER, an embodied-reasoning model, keeps track of the job. The VLA drives Apollo 2's five-finger hands, each with 22 degrees of freedom (separately driven joints). Tests ran in Kecskemét, Hungary, and Sindelfingen, Germany.

> 03 — THE RESULTS_

Gemini Robotics 2.5 beat version 2 on tasks that scored zero

Grey is Gemini Robotics 2, from earlier this year; blue is 2.5. Google reports 30% to 100% higher success depending on the task type, and jobs done 20% to 30% faster. Its own charts still show a tail of tasks near 10%. At Mercedes, 96% means roughly one miss every 25 picks.

> 04 — SAFETY_

Google says the model works more safely near people

The robot now reasons about physical hazards while it works. In Google's tests, safe task completion rose 33% around obstacles and 43% around people. Google also released ASIMOV-Jailbreak, open prompts that disguise unsafe requests. Gemini 4 Argon, its physical-reasoning model, resisted 99.5% of them, against 82% for the older ER 2.

> 05 — THE CATCH_

Google gives no trial count behind the Mercedes 96%

The Mercedes run was a proof-of-concept, not a deployment. Google's post doesn't say how many picks the 96% covers, how long the pilot lasted, or how fast Apollo worked next to a person.

There's no technical report yet, and every number comes from Google's own tests. The model goes to partners only, with no public API.

"Pairing Apollo 2 with Gemini Robotics, we saw the models improve dramatically in just a few weeks of post-training"

— JEFF CARDENAS, APPTRONIK CEO, NOV. 10, 2026
