

> NVIDIA's new robot AI learned mostly from videos of people. Five robot demos got it to 95%

GR00T 2 predicts the next video frames before it moves. How does human video teach a robot hand, and why is the 95% partly built in?

> 01 — WHAT HAPPENED

NVIDIA's GR00T 2 learns robot skills from human demos

1. HUMAN, MOCAP GLOVE

2. GR00T 2 ON ROBOT

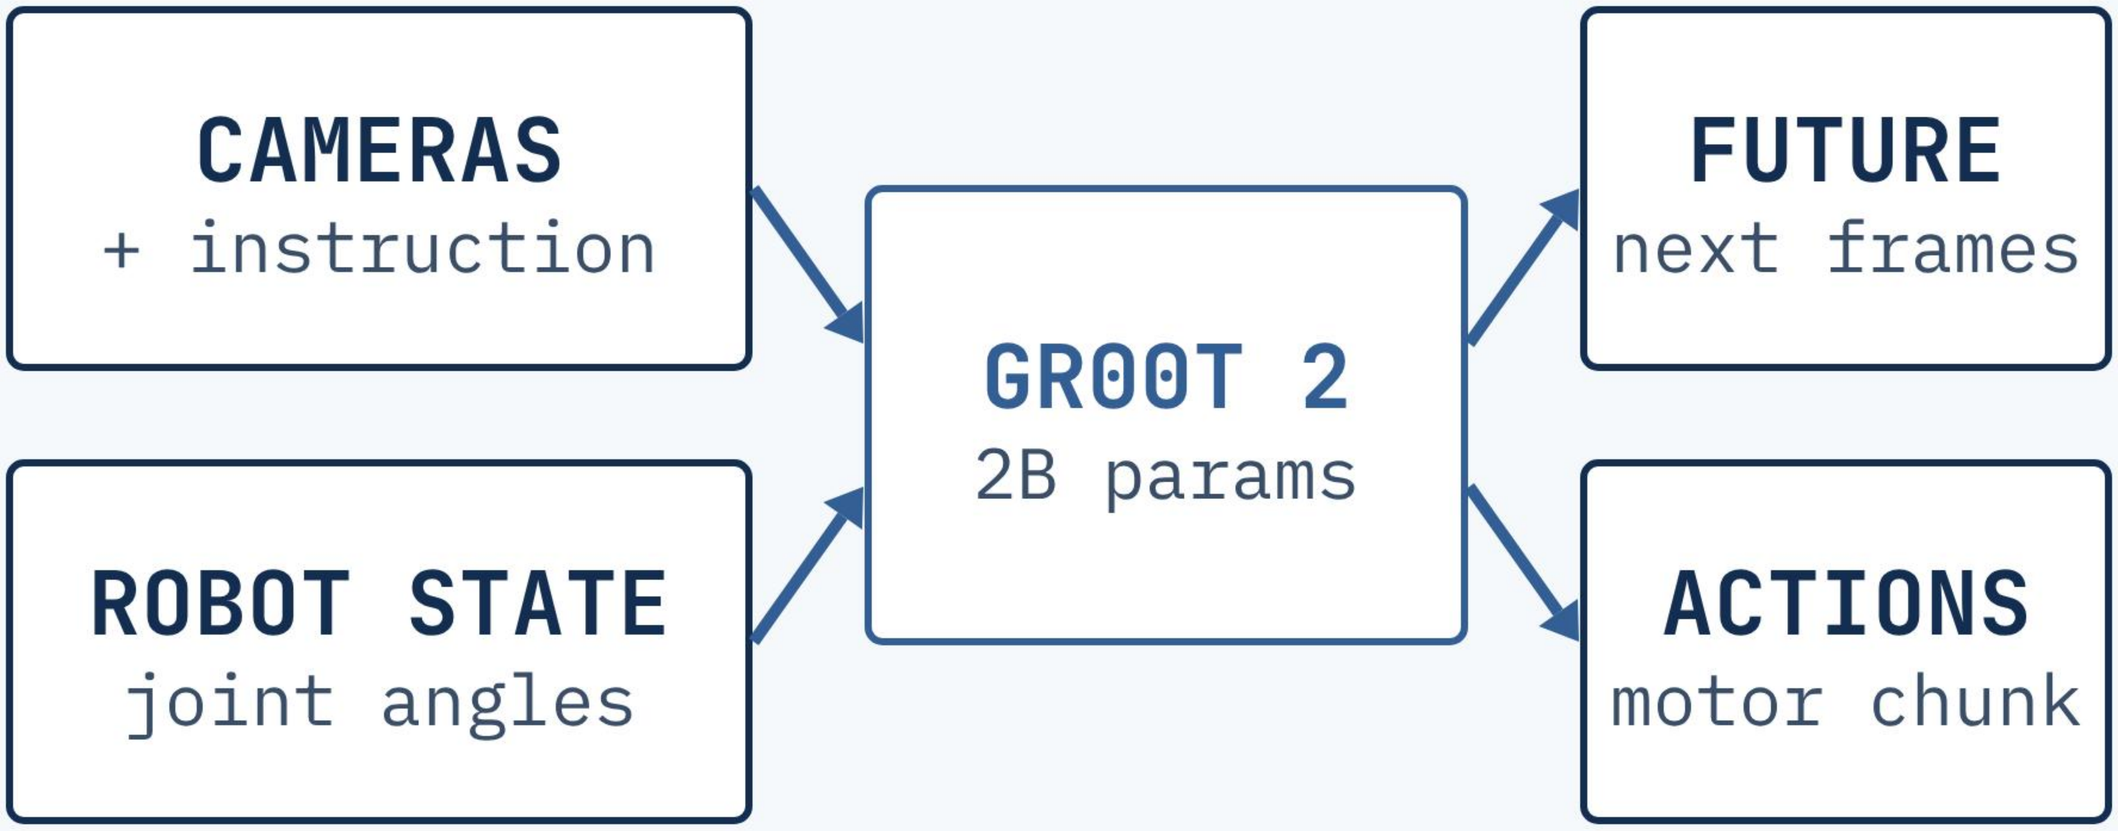

NVIDIA's GR00T 2 is a robot foundation model, one model meant for many robots. Left, a person in a motion-capture glove sets up filter paper. Right, Dexter, a robot with two 22-joint hands, does it with no teleoperated demo (a person remote-driving the robot).

Every hour of robot data needs a robot and an operator. Human video doesn't.

> 02 — HOW IT WORKS_

GR00T 2 predicts the next video frames, then moves

GR00T 2 is a world-action model: one network that predicts what its cameras will see next and the motor commands to get there. It starts from Cosmos, NVIDIA's video-generation model. Human video carries no motor commands, but the predict-the-next-frames half still learns from it, and the actions follow the future it imagines.

> 03 — THE DATA_

Human video is 92% of GR00T 2's training hours

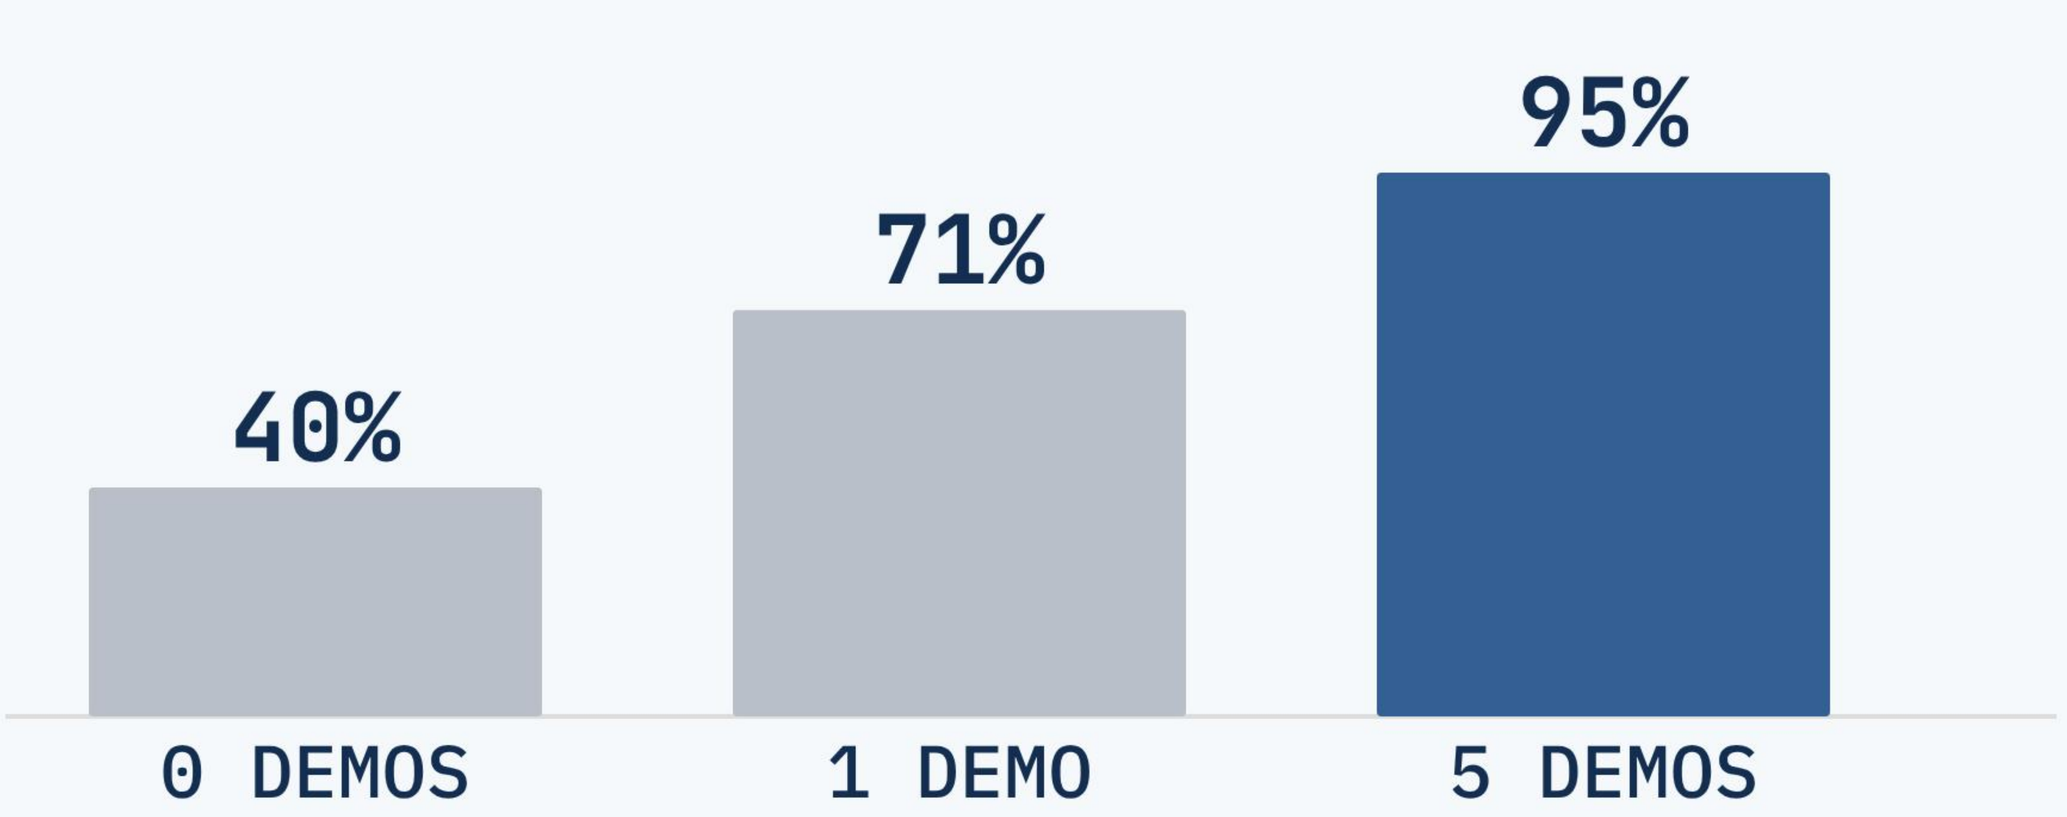

402,730 hours is about 46 years of first-person footage played nonstop. The handheld gripper is a tool shaped like a robot's, recording human demos. NVIDIA says success on new tasks more than doubled as human video grew, with no plateau yet. It is publishing 100,000 hours on Hugging Face.

> 04 — THE RESULTS

GR00T 2 hit 95% on 50 new tasks after five robot demos

The tasks were new to Dexter: they showed up only in another robot's data or in human video. Five demos is under three minutes of robot data, plus a 30-minute LoRA fine-tune (a small add-on trained on top) on one RTX 5090 GPU. On seven long hand tasks it averaged 68.6%; Physical Intelligence's π0.5 scored 0%.

> 05 — THE CATCH_

NVIDIA picked the 50 test tasks GR00T 2 learns well

NVIDIA's whitepaper says the 50 tasks were chosen among those the model reaches at least 80% on with five demos. Every number comes from NVIDIA's own tests.

Code is due in December; weights and license aren't stated. GR00T 2 Turbo, the version light enough for a humanoid's onboard computer, falls from 68.6% to 34.3% on the hand tasks.

"The five-episode rate is high partly by construction"

— NVIDIA, GR00T 2 WHITEPAPER, NOV. 2026
